ASIAN AMERICAN MEDICAL STUDENT EXPERIENCE

- Asian students are misconceptualized as the "model minority" and often not included in conversations of diversity, equity, and inclusion
- Studies have shown that Asian students are subject to bias and discrimination in medical school evaluations
- A 2017 study found that white students were nearly 2x more likely than Asian students to be members of the Alpha Omega Alpha Honor Society, even after controlling for USMLE Step 1 scores, research experiences, self-reported leadership activity hours, and community service even after restricting to students ranking in the top quartile of USMLE Step 1 scores

Table 1. Adjective comparison of White v. Asian medical student performance²,³

- Because the 20+ Asian ethnic groups are very different and are populated at different levels in the U.S., it is important to disaggregate data into ethnic subgroups
- Existing American Association of Medical Colleges (AAMC) data: Asian subgroups as applicants to medical school from 2018-2019
- Missing data: Asian subgroups as medical school matriculants in or any other part of medical training
- 2019 U.S. census data and 2018-2019 Asian subgroups AAMC applicant data show discrepancies in representation
- Discrepancies that already exist between the applicant data and U.S. census data underscores a skewed diversity outlook

STUDY AIMS

- Underscore current Asian American medical student diversity research and lack of data in disaggregate form and beyond medical school training
- Underscore discrepancies between medical school applicant disaggregated data and U.S. census Asian disaggregated data
- Call to action for increased diversity research and disaggregated diversity research on the Asian American medical student and beyond

CALL TO ACTION

At the medical school level, we believe the best ways to address issues faced by Asian medical students are

1. include coursework focused on Asian racism and health disparities in mandatory curriculum, while ensuring there is disaggregation of the Asian experience
2. make a conscious effort to include Asian students in diversity, equity, and inclusion conversation and initiatives
3. conduct research on the Asian medical student experience to better understand their specific issues and needs.

On the national level, we believe there are some ways to better represent data on Asians and Asian Americans in medicine.

1. better reporting of data disaggregation and data on matriculant data in medical schools and residencies
2. better reporting of data disaggregation on Asian subgroups in the physician working force
3. comparing the U.S. census disaggregate data to medical school matriculants and other trainees in the medical field to better discuss diversity in medicine and in the community
